### Coding competition

SOUNDEX() returns a character string containing the phonetic representation of char. This function lets you compare words that are spelled differently, but sound alike in English.

Algorithm is as follows:

1. The code is 4 characters wide
2. Retain the first letter of the string and remove all other occurrences of the following letters: a, e, h, i, o, u, w, y.

Assign numbers to the remaining letters (after the first) as follows:

- b, f, p, v = 1
- c, g, j, k, q, s, x, z = 2
- d, t = 3
- l = 4
- m, n = 5
- r = 6

3. If two or more letters with the same number were adjacent in the original name (before step 1), or adjacent except for any intervening h and w, then omit all but the first.

4. Return the first four bytes padded with 0.(c language string )

Examples:

Input	Output
Pradeep	P631
Pradip	P631
Paradip	P631
Paradeep	P631
AMRUTHA	A563
AMRUTA	A563
AMaRUTHA	A563
AMRUTH	A563

## 2. Program to encode given mobile number as Nambiar Number

Ex:1. i/p: 9860857152  
o/p: 3687

2. i/p: 9900114279  
o/p: 1824216

3. i/p: 9880127431  
o/p: 262141

### Algorithm:

- If the given mobile number is 9860857152
- First digit 9 is odd.
- First pass results in  $9+8+6+0+8+5=36$
- Second pass results in  $7+1=8$
- Third pass results in  $5+2=7$
- Note that the third pass stops at 7 (even though we do not meet a change of state) because we have reached the end of the mobile number
- For the mobile number 9860857152. the resultant number (Nambiar Number) will be the concatenation of the results of the 3 passes =  $[36][8][7] = 3687$
